

8.25" Front Differential

Remanufactured 8.25" Front Differentials for 1992-2006 GM Vehicles with Independent Front Suspension

If you notice an unusual noise coming from the vicinity of the differential, or if the vehicle wants to "jump", especially in tight turns, this could indicate a possible 8.25" Front Differential failure. Brand new units are no longer available. ATP's fully remanufactured differentials offer the best alternative to bench rebuilding the unit or buying used. These units are ready to install. Just add 3.5 pints of SAE 75W-90 Synthetic Axle Lubricant. All ratios (3.42, 3.73, and 4.10) are available.

Front Axle Disconnect

Front Axle Disconnect Assemblies for GM Applications

If the vehicle fails to engage into 2WD, 4WD, or AWD modes, if a "rattle" is audibly noticeable at low speeds, or if there is excessive play in the axle shaft connection to the Front Axle Disconnect, you may have a failing front axle disconnect. A front axle disconnect is a gearbox unit mounted against the front oil pan on the front passenger side that allows the driver to disengage from four wheel drive / all wheel drive to rear wheel drive. This part is failure prone and the new complete assembly is no longer available from the car dealer. Bench rebuilding, if parts are available, takes up to 2 hours. ATP's all new – not remanufactured – assembly eliminates this. It is engineered to exacting standards and is designed to replace the original.
